

CEL F Action Block List 1/8

Cells

Cells	Sheet	Data operation	Control	File operation	(Ne)
Set value  into cell 					Set value to cell or to cell range.
Clear cell 					Erase the value to designated cell or to cell range.
Copy cell(s)  to  <input type="checkbox"/> Paste special Paste values					Paste value and format from the source cell to the destination cell.
Apply format to cell  Preview Format					Set format of the designated cell.
Disable data input to cell 					Disable user input to enabled cell.
Enable data input to cell 					Enable user input to disabled cell.
Hide row 					Hide the designated rows.
Show row 					Unhide the hidden rows.
Toggle visibility of row 					Change the designated rows to Hide/Unhide.
Hide column 					Set the designated rows to hide.
Show column 					Set the designated rows to unhide.
Toggle visibility of column 					Change the designated columns to Hide/Unhide.
Insert 1  rows at 					Insert rows into the designated rows.
Delete 1  rows from row 					Delete rows from the designated rows.
Insert 1  columns at 					Insert columns into the designated columns.
Delete 1  columns from column 					Delete columns from the designated columns.
Set cell  as filter range 					Set cell rage to filter range.
Cancel filter range 					Unlock the filter range.
Clear filter(s) 					Remove the current filter(s) constraints while retaining the scope of the applied filter(s).
Replace cell(s)  with Value after formula evaluation  String to find  String after replacement 					Replaces the specified cell with the target string.
Restore cell(s)  value to the state of the sheet as initially displayed 					Set the specified cell(s) value to the sheet initial state.

Sheets

Cells	Sheet	Data operation	Control	File operation
Switch to sheet  of application (Current application) 		Change the displayed sheet in the current window.		
Parameter 				
Show sheet  of application (Current application)  in new window 		Show the designated sheet in the new window.		
<input type="checkbox"/> Limit operation to active window 				
<input type="checkbox"/> Allow window size change				
Parameter 				
Close sheet 		Close the current window.		
Parameter 				
In sheet (Current sheet)  run action 		Run the designated action in the current sheet.		
In sheet  Set value  into cell 		Set value in the designated sheet and cell.		
Save sheet (Current sheet)  as an Excel file 		Save as Excel file in the designated sheet and file name.		
<input checked="" type="radio"/> Select file with pop-up dialog				
<input type="radio"/> Use the specified path				
 				
<input type="checkbox"/> Output the calculation result of the formula 				
Print (Current sheet)  sheet 		Print the designated sheet out.		
<input checked="" type="checkbox"/> Show print preview 				
Save sheet (Current sheet)  as a PDF file 		Save as PDF file in the designated sheet and file name.		
<input checked="" type="radio"/> Select file with pop-up dialog				
<input type="radio"/> Use the specified path				
 				
Copy cell(s)  to  on sheet 		Copy and paste the specified cell into other sheet.		
<input type="checkbox"/> Paste special  Paste values 				

Data operation

Cells	Sheets	Data operation	Control	File operation
<p>Get multiple records from table <input type="text"/>  </p> <p>Setting of columns and display destination</p> <p>Search condition</p> <p>Sort condition</p> <p><input type="checkbox"/> Specify the start position of records to get. <input type="text"/>  th record </p> <p><input type="checkbox"/> Limit the number of records to get. <input type="text"/>  records </p>				
			Output identified data with the condition.	
<p>Get one record from table <input type="text"/>  </p> <p>Search condition</p>				
			Output a record identified with the condition from the designated table.	
<p>Get the number of records from table <input type="text"/>  </p> <p>Set the number in the next cell <input type="text"/>  </p> <p>Search condition</p>				
			Output the number of records identified with the condition from the designated table.	
<p>Insert data to table <input type="text"/>  </p> <p><input type="checkbox"/> Set the registered ID in the next cell  </p>				
			Register new data in the designated table.	
<p>Update data in table <input type="text"/>  </p> <p><input type="checkbox"/> An error if the other user had been updated or deleted </p> <p>Update condition</p>				
			Update identified data with the condition from the designated table.	
<p>Get multiple records from table <input type="text"/>  </p> <p>Grouping key </p> <p>Settings for columns to show and its aggregate function</p> <p>Condition for pre-aggregation</p> <p>Condition for post-aggregation </p> <p>Sort condition </p>				
			Aggregate data from the designated table, then output into the sheet.	
<p>Delete data from table <input type="text"/>  </p> <p><input type="checkbox"/> An error if the other user had been updated or deleted </p> <p>Delete condition</p>				
			Delete identified data with the condition from the designated table.

Save value of cell  with name 

Paste value of saved name  to cell 

Delete saved name 

Send HTTP request to the following URL 

URL 

Parameter 

Send an email in the following content 

TO 

CC 

BCC 

Subject 

Attachment 

Cross-tabulate the data of the sheet  

Setting tabulation method

	<div>Horizontal axis </div> <div></div> <div><input type="checkbox"/> Total display</div>
<div>Vertical axis </div> <div></div> <div><input type="checkbox"/> Total display</div>	<div>Data </div> <div></div>

Setting output method

Display start cell 

Color themes 

Decimal places: 

☐ Display tabulation values using 1000 separator

Import data of CSV file to table 

CSV file path 

Select character code 

☐ Set the registration date and time in the next cell 

☐ Set the number of registrations in the next cell 

Export data of table  as a CSV file 

CSV file path 

Select character code 

Save value in the chosen cell as the designated name in the PC temporarily.

Paste value in the chosen cell as the designated name in the PC temporarily.

Delete the value saved with the designated name in the PC temporarily.

HTTP query sends HTTP request to the designated URL. You can set prefer number of cell address as the parameter, and send the cell value as the URL parameter.

Send mail.

Create cross tab from the chosen sheet.

Cross tab is the way to analyze and aggregate from multi data. By description fields assigned vertically and horizontally, the relationship will be cleared.

Register CSV file data to the specified table.

Save the data of the specified table to CSV file.

Show the following message as a pop-up 

Show the following inquiry as a pop-up

Set result to cell 

Show the following inquiry before closing sheet as a pop-up 

Set result to cell 

If the condition value is true, execute that code block. If all condition values are false, execute the bottom code block.

Run continuously while the designated condition is true.

Repeat processing of the allocated blocks for the specified number of times.

Inside the block including this action, run action is skipped. In case of multi-sub block, the innermost action is skipped.

Inside the block including this action, run action ends. In case of multi-sub block, the innermost action ends.

Look for a case value in this action that equals the switch value. If a matching case value is found, execute the code block associated with the matching case value.

Run upper block in the case CELF online, otherwise run lower block.

Popup the input message here.

Open the popup window with "OK/Cancel" button. The question is the designated value as the message. The value user chose is set in the designated cell.

Open the popup window with 'Close'/'Cancel' buttons when closing a sheet to control the sheet closing operation.

Set data in Excel file to cell ?

☒ Select file with popup dialog

☐ Use the specified path

Excel sheet name to read ?

Where to set the data + ?

set ? to ?

Set Excel file data to the designated cell at the starting point.

Set cell data to Excel file ?

☒ Select file with popup dialog

☐ Use the specified path

Excel sheet name to write ?

Where to set the data + ?

set ? to ?

Sets the value of a specified cell or range of cells to an Excel sheet.

Read CSV files, convert data then save them. ?

Input CSV file settings

Specify the input file **File definition setting**

(Set the file definition.)

Join conditions between file definitions

Filtering conditions

Sort condition

☐ Delete duplicate rows (rows with the same value in all columns)

Output CSV file settings

Specify the output file

Output file path ?

☐ Output the title on the first line of the file

Char encoding of the file **Shift-JIS**

Reads the specifies CSV file, performs various data processing, and output a new CSV file.
